REVISION SUMMARY
2 Introduction

Intertek Testing Services NA Ltd. (Intertek) has conducted testing for Cement Board Fabricators Inc, to evaluate the surface burning characteristics of Silbonit Fiber-cement Flat Sheets. Testing was conducted in accordance with the standard methods of ASTM E84-12c, Standard Test Method for Surface Burning Characteristics of Materials.

This evaluation began April 12, 2013 and was completed the same day.

3 Test Samples

3.1. SAMPLE SELECTION

Samples were submitted to Intertek directly from the client and were not independently selected for testing. The sample material was received at the Evaluation Center on April 8, 2013.

3.2. SAMPLE AND ASSEMBLY DESCRIPTION

The product sample was supplied and described by the client as "Silbonit Fiber-cement Flat Sheets" and consisted of 5/16 in. thick by 24 in. wide by 8 ft long.

For this test run three 8 ft. long panels were placed on the upper ledge of the flame spread tunnel, and butted together to form the required 24 ft. sample length. A layer of 6 mm reinforced cement board was placed over top of the samples, the tunnel lid was lowered into place, and the samples were then tested to ASTM E84-12c.
4 Testing and Evaluation Methods

4.1. TEST STANDARD

The results of the tests are expressed by indexes, which compare the characteristics of the sample under tests relative to that of select grade red oak flooring and inorganic-cement board.

(A) Flame Spread Classification:

This index relates to the rate of progression of a flame along a sample in the 25 foot tunnel. A natural gas flame is applied to the front of the sample at the start of the test and drawn along the sample by a draft kept constant for the duration of the test. An observer notes the progression of the flame front relative to time. This information is plotted on a graph (flame spread curve).

The test apparatus is calibrated such that the flame front for red oak flooring passes out the end of the tunnel in five minutes, thirty seconds (plus or minus 15 seconds).

(B) Smoke Developed:

A photocell is used to measure the amount of light, which is obscured by the smoke passing down the tunnel duct. When the smoke from a burning sample obscures the light beam, the output from the photocell decreases. This decrease with time is recorded and compared to the results obtained for red oak, which is defined to be 100.
5 Testing and Evaluation Results

5.1. RESULTS AND OBSERVATIONS

(A) Flame Spread

The resultant flame spread classifications are as follows:
(classification rounded to nearest 5)

<table>
<thead>
<tr>
<th>Sample</th>
<th>Flame Spread</th>
<th>Flame Spread Classification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Silbonit Fiber-cement Flat Sheets</td>
<td>1</td>
<td>0</td>
</tr>
</tbody>
</table>

(B) Smoke Developed

The areas beneath the smoke developed curve and the related classifications are as follows:
(For smoke developed indexes 200 or more, classification is rounded to the nearest 50. For smoke developed indexes less than 200, classification is rounded to nearest 5)

<table>
<thead>
<tr>
<th>Sample</th>
<th>Smoke Developed</th>
<th>Smoked Developed Classification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Silbonit Fiber-cement Flat Sheets</td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>

(C) Observations

There was no visible surface ignition or smoke.
6 Conclusion

The sample of 5/16 in thick Silbonit fiber-cement flat sheets, submitted by Cement Board Fabricators Inc., exhibited the following flame spread characteristics when tested in accordance with ASTM E84-12c, *Standard Test Method for Surface Burning Characteristics of Materials*.

<table>

APPENDIX A

DATA SHEETS
ASTM E84-12c DATA SHEETS

ASTM E84

Client: Cement Board Fabricators
Date: 04 12 2013
Project Number: 101113787
Test Number: 1
Operator: Greg Philp
Specimen ID: Silbonit Fiber Cement Flat Sheets

TEST RESULTS

FLAMESPREAD INDEX: 0
SMOKE DEVELOPED INDEX: 0

SPECIMEN DATA . . .

Time to Ignition (sec): 0
Time to Max FS (sec): 366
Maximum FS (feet): 0.5
Time to 980 F (sec): Never Reached
Time to End of Tunnel (sec): Never Reached
Max Temperature (F): 466
Time to Max Temperature (sec): 596
Total Fuel Burned (cubic feet): 42.00

FS*Time Area (ft\(^2\)*min): 2.0
Smoke Area (%A*min): 0.2
Unrounded FSI: 1.0
Unrounded SDL: 0.2

CALIBRATION DATA . . .

Time to Ignition of Last Red Oak (Sec): 44.0
Red Oak Smoke Area (%A*min): 95.9
